INTERNET INTERMEDIARY LIABILITY: WILMap, THEORY AND TRENDS

Giancarlo F. Frosio*

forthcoming in 12 Indian Journal of Law and Technology (2017)

ABSTRACT

To better understand the heterogeneity of the international online intermediary liability regime—with the collaboration of an amazing team of contributors across five continents—I have developed and launched the World Intermediary Liability Map (WILMap), a detailed English-language resource hosted at Stanford CIS and comprised of case law, statutes, and proposed laws related to intermediary liability worldwide. Since its launch in July 2014, the WILMap has been steadily and rapidly growing. Today, the WILMap covers almost one hundred jurisdictions in Africa, Asia, the Caribbean, Europe, Latin America, North America and Oceania. After introducing the WILMap—and the surrounding landscape of recent projects related to intermediary liability—this article aims at discussing advancement in intermediary liability theory and describing emerging regulatory trends.

I. INTRODUCTION

Unsurprisingly, online intermediaries' obligations, liabilities, and responsibilities increasingly take the center stage of Internet policy. However, inconsistencies across different regimes generate legal uncertainties that undermine both users' rights and business opportunities. To better understand the heterogeneity of the international online intermediary liability regime—with the collaboration of an amazing team of contributors across five continents—I have developed and launched the World Intermediary Liability Map (WILMap), a detailed English-language resource hosted

at Stanford CIS and comprised of case law, statutes, and proposed laws related to intermediary liability worldwide.¹

Mapping online intermediary liability worldwide serves the goal of understanding responsibilities that OSPs bear in contemporary information societies. Most creative expression today takes place over communications networks owned by private companies. OSPs' role is unprecedented for their capacity to influence the informational environment and users' interactions within it. The ethical implications of OSPs' role in contemporary information societies are raising unprecedented social challenges, as proven by recent examples like the PRISM scandal and the debate on the "right to be forgotten".

Mapping online intermediary liability worldwide entails the review of a wide-ranging topic, stretching into many different areas of law and domain-specific solutions. The WILMap has become a privileged venue to observe emerging trends in Internet jurisdiction and innovation regulation, enforcement strategies dealing role of Internet platforms with intermediate liability for copyright, trademark, and privacy (right to be forgotten) infringement, and the in moderating the speech they carry for users, including obligations and liabilities for defamation, hate and dangerous speech. Mapping online intermediary liability worldwide should help magnifying on gaps in policies and existing legal frameworks regulating OSPs and possible strategies to overcome it.

II. THE WILMAP PROJECT

By their nature, Internet services are inherently global, but Internet companies face a real challenge understanding how those global regimes might regulate the services they offer to the public. In search for consistency—and to contribute to this important policy debate—I developed the World Intermediary Liability Map (WILMap), a repository of information on international liability regimes.² The WILMap is a graphic interface for legislation and case law enabling the public to learn about intermediary liability regimes worldwide and evolving Internet regulation affecting freedom of expression and user rights. This detailed English-language resource allows visitors to select information on countries of interest, including case law, statutes, and

¹ World Intermediary Liability Map (WILMap) (a project designed and developed by Giancarlo Frosio and hosted at Stanford CIS), <https://cyberlaw.stanford.edu/our-work/projects/world-intermediary-liability-map-wilmap> [hereinafter WILMap]. Please note that most legislation and caselaw cited can be found at the relevant WILMap country page. Direct links are embedded in the citation.

² The Stanford Intermediary Liability Lab (SILLab), another project I launched at Stanford Law School in 2013, functioned as an incubator for developing the WILMap and study international approaches to intermediary obligations concerning users' copyright infringement, defamation, hate speech or other vicarious liabilities, immunities, or safe harbors. See Stanford Intermediary Liability Lab, <https://www.facebook.com/groups/ILLab>; see also CIS, Intermediary Liability, <https://cyberlaw.stanford.edu/focus-areas/intermediary-liability>.

proposed laws. Each country page includes links to original sources and English translations, if available. As the WILMap website, programmatically states, this resource should be used “to learn about intermediary liability regimes worldwide, and to identify places where legal regimes balance—or fail to balance—regulatory goals with free expression and other civil liberties.”³

The WILMap features legislation, pending bills and proposals imposing obligations on intermediaries, both access and hosting providers or other online intermediaries, such as payment processors. The WILMap covers wide-ranging topics, including online intermediaries' safe harbors, e-commerce, copyright and trademark protection, defamation, hate/dangerous speech, including anti-terrorism provisions, privacy protection, and child protection online. If available, the WILMap includes relevant case law for each jurisdiction. Basically, the WILMap would like to features any case law discussing obligations and liability of online intermediaries due to (infringing) activities undertaken by their users. The WILMap also features sections for administrative enforcement of intermediary liability online, if there are administrative agencies in charge with implementing website blocking orders or content removal in a certain jurisdiction.

Since its launch in July 2014, the WILMap has been steadily and rapidly growing. Today, the WILMap covers almost one hundred jurisdictions in Africa, Asia, the Caribbean, Europe, Latin America, North America and Oceania. The WILMap is an ongoing project. In collaboration with a network of experts worldwide, CIS continues to update and expand the map, with the goal of covering all jurisdictions. In an effort to make the WILMap an increasingly valuable resource for activists, industry players, researchers, and the general public, the WILMap website will be soon updated with enhanced usability and data aggregation features.

The WILMap project has been made possible by an amazing team of contributors from around the world, both individual researchers and institutions, providing the necessary information to create and update each country page. The creation of a global network of WILMap contributors also allowed to promote synergies with global platforms and free expression groups to advocate for policies that will protect innovation and other user rights.⁴

II. OTHER INTERMEDIARY LIABILITY PROJECTS

WILMap's attempt to study intermediary liability to come at terms with a fragmented legal framework is not isolated. Mapping and comparative analysis

exercises have been undertaken by the Network of Centers—which produced a case study series exploring online intermediary liability frameworks and issues in Brazil, the European Union, India, South Korea, the United States, Thailand, Turkey, and Vietnam⁵—WIPO,⁶ and other academic initiatives.⁷

Institutional efforts at the international level are on the rise. Recently, the Global Multistakeholder Meeting on the Future of Internet Governance (NETmundial) worked towards the establishment of global provisions on intermediary liability within a charter of Internet governance principles.⁸ The final text of the NETmundial Statement included the principle that

[i]ntermediary liability limitations should be implemented in a way that respects and promotes economic growth, innovation, creativity and free flow of information. In this regard, cooperation among all stakeholders should be encouraged to address and deter illegal activity, consistent with fair process.⁹

A few months earlier, the Organization for Economic Co-operation and Development (OECD) issued recommendations on Principles for Internet Policy Making stating that, in developing or revising their policies for the Internet Economy, the State members should consider the limitation of intermediary liability as a high level principle.¹⁰ Also, the 2011 Joint Declaration of the three Special Rapporteurs for

Freedom of Expression apparently contains statements that would suggest an ongoing search for a global regime for intermediary liability.¹¹ After reinforcing the mere conduit principle, the declaration suggested liability limitations for other intermediaries, including hosting providers, search engines, and those enabling financial transactions.¹² The Representative on Freedom of the Media of the Organization for Security and Cooperation in Europe (OSCE) issued a *Communiqué on Open Journalism*, the goal of which is to advise the organization's 57 member states on best practices with regards to digital rights and intermediaries.¹³ In particular, the Communiqué laid out a set of recommendations in recognition of the fact that “intermediaries have become one of the main platforms facilitating access to media content as well as enhancing the interactive and participatory nature of Open Journalism.”¹⁴

Efforts to produce guidelines and general principles for intermediaries emerged also in the civil society. In particular, the Manila Principles on Intermediary Liability sets out safeguards for content restriction on the Internet with the goal of protecting users' rights, including “freedom of expression, freedom of association and the right to privacy.”¹⁵ A set of general principles is accompanied by sub-principles and a background paper qualifying some of the terminology and statements included in the principles.¹⁶ The six main principles are summarized below:

- (1) Intermediaries should be shielded by law from liability for third-party content.
- (2) Content must not be required to be restricted without an order by a judicial authority.
- (3) Requests for restrictions of content must be clear, be unambiguous, and follow due

process. (4) Laws and content restriction orders and practices must comply with the tests of necessity and proportionality. (5) Laws and content restriction policies and practices must respect due process. (6) Transparency and accountability must be built in to laws and content restriction policies and practices.¹⁷

The Manila Principles have been so far well received by the international community. For example, institutional initiatives such as the OCSE Communiqué on Intermediaries mentioned before made full reference to the Manila Principles in its draft recommendations.¹⁸

Other projects developed best practices that might be implemented by intermediaries in their terms of service with special emphasis on protecting fundamental rights.¹⁹ For example, under the egis of the Internet Governance Forum, the Dynamic Coalition for Platform Responsibility aims to delineate a set of model contractual-provisions.²⁰ This provisions should be compliant with the UN “Protect, Respect and Remedy” Framework as endorsed by the UN Human Rights Council together with the UN Guiding Principles on Business and Human Rights.²¹ Appropriate digital labels should signal the inclusion of these model contractual provisions in the Terms of Service of selected platform providers to “help Internet users to easily identify the platform-providers who are committed to securing the respect of human rights in a responsible manner.”²² Again, the Global Network Initiative (GNI) put together a multi-stakeholder group of companies, civil society organizations, investors and academics to create a global framework to protect and advance freedom of expression and privacy in information and communications technologies. The GNI’s participants—such as Facebook, Google, LinkedIn, Microsoft and Yahoo—committed to a set of core documents, including the GNI Principles, Implementations Guidelines and Accountability, Policy & Learning Framework.²³

Ranking Digital Rights is an additional initiative that promotes best practices and transparency among online intermediaries.²⁴ This project ranks Internet and telecommunications companies according to their virtuous behavior in respecting users' rights, including privacy and freedom of speech. In November 2015, the first project's report ranked 16 companies, in different countries, on 30 different measures.²⁵ Companies scored between 65 and 13 percent.²⁶ Most companies received a failing grade for their public commitments and disclosed policies affecting users' freedom of expression and privacy.²⁷

Several initiatives have been looking into notice and take down procedures in order to highlight possible chilling effects and propose solutions. Lumen—formerly Chilling Effects—archives takedown notices to promote transparency and facilitate research about the takedown ecology.²⁸ The Takedown Project is a collaborative effort housed at UC-Berkeley School of Law and the American Assembly to study notice and takedown procedures.²⁹ The Takedown Project launched the Notice Coding Engine looking at the impact of automated both sending and receiving process of notice and takedown.³⁰ Again, the Internet and Jurisdiction project has been developing a due process framework to deal more efficiently with transnational notice and take down requests, seizures, MLAT and law enforcement cooperation requests.³¹ The

framework will be based on the creation of a legal reference database to support the assessment of take down requests.³² Finally, apart from establishing good practice standards for notices, the Manila Principles initiatives made available a template notice of content restriction as a mock-up web form that can be adopted by intermediaries.³³

III. FROM INTERMEDIARY LIABILITY TO RESPONSABILITY

Intermediary liability has become one of the most critical Internet governance issues of our time. In particular, modern theory—and policy—still struggles with defining an adequate framework for the liability and responsibility of OSPs for user-generated content. Does OSP's role differs from the one of publishers, mass-media, and gate-keepers? Should innocent third parties be enlisted in online enforcement? If so, what are the jurisdictional boundaries of their obligations? These are tough questions to answer that have received miscellaneous answers so far even within the same jurisdiction. The theoretical—and market—background against which the intermediary liability debate developed has changed considerably since the first appearance of online intermediaries almost two decades ago. These changes reflected—or will soon most likely reflect—in changing policy approaches.

In the mid-nineties, after initial brief hesitation,³⁴ legislators decided that online intermediaries, both access and hosting providers, had to enjoy exemptions to liability for wrongful activities committed by users through their services. The United States introduced these safe harbors first. In 1996, the Communications Decency Act exempted intermediaries from liability for the speech they carry.³⁵ In 1998, the Digital Millennium Copyright Act introduced specific intermediary liability safe harbors for copyright infringement under more stringent requirements.³⁶ Shortly thereafter, the eCommerce Directive imposed to Member States the obligation of enacting similar

³⁶ See The Digital Millennium Copyright Act of 1998, 17 U.S.C. § 512 [hereinafter DMCA]

legal arrangements to protect a range of online intermediaries from liability.³⁷ Other jurisdictions followed suit in more recent times.³⁸ In most cases, safe harbor legislations provide mere conduit, caching, and hosting exemptions for intermediaries, together with the exclusion of a general obligation on online providers to monitor the information which they transmit or store or actively seek facts or circumstances indicating illegal activity.³⁹

Bringing pressure to innocent third parties that may enable or encourage violations by others is a well-established strategy to curb infringement. Actually, forcing third parties to act affirmatively to curb infringement would increase the level of compliance to the law. Intermediaries' secondary liability has been based on different theories ranging from moral to utilitarian approaches. A moral approach would argue that encouraging infringement is widely seen as immoral.⁴⁰ The second approach is associated with the welfare theory and, more broadly, with a utilitarian approach to law in general. This approach was pioneered thirty years ago by Reiner Kraakman's seminal article, which set the foundations of the so-called "gatekeeper theory" that will be influential in shaping early online intermediaries' policies.⁴¹ Welfare theory approaches have been dominant in intermediary liability policy until recently. They have been based on the notion that liability should be imposed only as a result of a

cost-benefit analysis, which is especially relevant in case of dual-use technologies that can be deployed both to infringe others' rights and facilitate social beneficial uses.⁴²

Apparently, however, there is an ongoing revival of moral approaches to intermediary liability. Legal theory is increasingly shifting the discourse from liability to enhanced "responsibilities" for intermediaries under the assumption that OSPs' role is unprecedented for their capacity to influence the informational environment and users' interactions within it. This move from intermediary liability to platform responsibility has been occurring at theoretical and practical level, with special focus on intermediaries' corporate social responsibilities and their role in implementing and fostering human rights.⁴³ As Martin Husovec argued, the European Union law for example increasingly forces Internet intermediaries to work for the right holders by making them accountable even if they are not tortiously liable for actions of their users.⁴⁴

However, there are also counter-posing forces at work in the present internet governance struggle. A centripetal move towards digital constitutionalism for Internet governance alleviates the effects of the centrifugal platform responsibility discourse. Efforts to draft an "Internet Bill of Rights" can be traced at least as far back as the mid-1990s.⁴⁵ Two full decades later, aspirational principles have begun to crystallize into law. Gill, Redeker and Gasser have described more than thirty initiatives spanning from 1999 to 2015 that can be labelled under the umbrella of "digital

constitutionalism.”⁴⁶ These initiatives have great differences—and range from advocacy statements to official positions of intergovernmental organizations to proposed legislation—but belong to a broader proto-constitutional discourse seeking to advance a relatively comprehensive set of rights, principles, and governance norms for the Internet.⁴⁷

IV. GLOBAL INTERMEDIARY LIABILITY TRENDS

Mapping online intermediary liability worldwide entails the review of a wide-ranging topic, stretching into many different areas of law and domain-specific solutions. The WILMap has become a privileged venue to observe emerging trends in Internet jurisdiction and innovation regulation, enforcement strategies dealing with intermediate liability for copyright, trademark, and privacy (right to be forgotten) infringement, and Internet platforms’ obligations and liabilities for defamation, hate and dangerous speech. The data set collected in the WILMap made possible to identify recent trends in intermediary liability policy.

Since the enactment of the first safe harbors and liability exemptions for online intermediaries, market conditions have radically changed. Originally, intermediary liability exemptions were introduced to promote an emerging Internet market. Do safe harbors for online intermediaries still serve innovation? Should they be limited or expanded? These critical questions—often tainted by protectionist concerns—define the present intermediary liability conundrum. Apparently, safe harbours still hold, although secondary liability for illegal content online is on the rise.

Besides a consistent enforcement of online intermediaries’ safe harbors in the United States,⁴⁸ several emerging economies have been bringing their legal system up to digital speed. Recently, the Brazilian Marco Civil da Internet—or Internet Bill of Rights—introduced a civil liability exemption for Internet access providers and other Internet providers.⁴⁹ In the case of hosting providers, Article 19 provides that, “in order to ensure freedom of expression and to prevent censorship, an Internet

⁴⁶ *Id.*, at 1.

⁴⁷ *Id.*

⁴⁸ However, the United States Copyright Office is undertaking a public study to evaluate the impact and effectiveness of the safe harbor provisions. In particular, notice-and-stay-down arrangements—rather than take-down—are under review in the United States as well as elsewhere. See United States Copyright Office, Section 512 Study, <http://copyright.gov/policy/section512>; see also *BMG Rights Management (US) LLC et al v. Cox Enterprises, Inc. et al*, 14-cv-110 (August 9, 2016) (confirming a [jury verdict of December 2015](#) holding that Cox—the broadband provider—forfeited the immunity of the Digital Millennium Copyright Act by not blocking music piracy by its subscribers after BMG alerted Cox to the wrongdoing of individual infringers identified by Rightscorp, a provider of litigation services against copyright infringers).

⁴⁹ See Marco Civil da Internet, Federal Law no. 12.965, April 23, 2014, Article 18 (“the Internet connection [access] provider shall not be subject to civil liability for content generated by third party”)

application provider shall only be subject to civil liability for damages caused by virtue of content generated by third parties if, after specific court order, it does not take action [. . .] to make the infringing content unavailable.”⁵⁰ This broad civil—and not criminal—liability exemption, however, does not apply to copyright infringement.⁵¹ Other African, Asian and South American countries have been discussing the introduction of a safe harbour regime for quite some time now. The Hong Kong government, for example, introduced a copyright bill establishing a statutory safe harbor for online service providers for copyright infringement, provided that OSPs meet certain prescribed conditions, including the taking of reasonable steps to limit or stop copyright infringement when being notified.⁵²

Nonetheless, safe harbors’ recalibration towards more secondary liability for online intermediaries does characterize the recent international policy debate. There is an increasing number of cracks that appear in safe harbour arrangements for online intermediaries. Increased intermediary accountability has become a globalized trend that has been emerging in Europe, Asia, South America, Africa and Australia.

As anticipated, voluntary and private censorship of allegedly illegal content online—shifting the discourse from intermediary liability to intermediary responsibility or accountability—is a core policy trend. Voluntary measures—which the European Commission would like to promote among platforms—do shake the EU intermediary liability system. Hosting providers—especially platforms—would be called to actively and swiftly remove illegal materials, instead of reacting to complaints. The OP&DSM Communication puts forward the idea that “the responsibility of online platforms is a key and cross-cutting issue.”⁵³ In other words, intermediary liability expansion—and limitation of safe harbors—will occur by imposing an obligation on online platforms to behave responsibly by addressing specific problems. The Commission aligns its strategy for online platforms to a globalized, ongoing move towards privatization of law enforcement online through algorithmic tools.⁵⁴ Coordinated EU-wide self-regulatory efforts by online platforms

should immediately be directed to fight incitement to terrorism and prevent cyber-bullying.⁵⁵ Actually, as an immediate result of this new policy trend, the Commission recently agreed with all major online hosting providers—including Facebook, Twitter, YouTube and Microsoft—on a code of conduct that includes a series of commitments to combat the spread of illegal hate speech online in Europe.⁵⁶ In this context, tech companies plan to create a shared database of unique digital fingerprints—known as ashes—that can identify images and videos promoting terrorism.⁵⁷ Some EU member States such as Germany may even bring in a law to impose fines of up to €500,000 on a platform failing to take down illegal content within 24 hours.⁵⁸ On the intellectual property enforcement side, payment blockades—notice-and-termination agreement between major right holders and online payment processors—and "voluntary best practices agreements" for copyright and trademark enforcement have been applied widely, especially in the United States.⁵⁹ Payment processors like MasterCard and Visa have been pressured to act as intellectual property enforcers, extending the reach of intellectual property law to websites operating from servers and physical facilities located abroad.⁶⁰ In the *Communication Towards a Modern, More European Copyright Framework*, the Commission apparently would like to endorse similar strategies by deploying a 'follow-the-money' approach.⁶¹ As the Commission noted, this strategy 'can deprive those engaging in commercial infringements of the revenue streams (for example from consumer payments and advertising) emanating from their illegal activities, and therefore act as a deterrent'.⁶² According to the Commission,

⁶² *ibid* 11.

‘follow-the-money’ mechanism should be based on a self-regulatory approach through the implementation of Code of Conducts that might be later backed up by legislation if necessary.

As part of its Digital Single Market Strategy, the European Commission has been seriously considering for some time now narrowing the eCommerce Directive horizontal liability limitations for Internet intermediaries⁶³ and putting in place a “fit for purpose”—or vertical—regulatory environment for platforms and intermediaries.⁶⁴ Apparently, the European Commission is planning the introduction of enhanced obligations that websites and other Internet intermediaries should have for dealing with unlawful third-party content.⁶⁵ In particular, the Commission is discussing what regulations should apply to a subset of those intermediaries deemed “online platforms” and “whether to require intermediaries to exercise greater responsibility and due diligence in the way they manage their networks and systems—a duty of care”⁶⁶ with the aim to achieve a fairer allocation of value generated by the distribution of copyright-protected content by online platforms.⁶⁷ The Commission presented this platform-sensitive update of the EU copyright policy in a proposal for a Directive on Copyright in the Digital Single Market,⁶⁸ which is part of a larger package aiming at modernizing EU copyright rules and achieving a fully functioning Digital Single

⁶³ See Patrick Van Eecke, *Online Service Providers and Liability: A Plea for a Balanced Approach*, 48(5) COMMON MARKET L. REV. 1455, 1463 (2011) (noting that “Section 4 [of the eCommerce Directive] introduces a horizontal special liability regime for the three types of service providers covered by it. Provided they meet the criteria laid down in Section 4, the service providers will be exempted from contractual liability, administrative liability, tortious / extra-contractual liability, penal liability, civil liability or any other type of liability, for all types of activities initiated by third parties, including copyright and trade mark infringements, defamation, misleading advertising, unfair commercial practices, unfair competition, publications of illegal content, etc.”)

⁶⁴ See European Commission, Communication, A Digital Single Market Strategy for Europe, COM(2015) 192 final, May 6, 2015, at § 3.3 available at http://ec.europa.eu/priorities/digital-single-market/docs/dsm-communication_en.pdf [hereinafter Digital Single Market Strategy]. Market.⁶⁹ A groundbreaking provision aiming at closing the “value gap”—and affecting closely online intermediaries—is the introduction of an ancillary right for the reproduction and making available to the public of press publications in respect of digital uses.⁷⁰ The proposed reform also includes a second provision that would impact platform operations broadly in order to close the so called-value gap. It requires intermediaries “that store and provide access to large amounts of works [. . .] uploaded by their users” to take appropriate and proportionate “measures to ensure the functioning of agreements concluded with rightholders for the use of their works” or “to prevent the availability on their services of [such] works,” including through “the use of effective content identification technologies.”⁷¹ Meanwhile, some Member States already took that regulatory path or are in the process of doing so. The German coalition agreement included the prospect of expanded hosting provider liability for online copyright infringement.⁷² In 2013, Germany already amended its Copyright Law by providing exclusive neighbouring rights to press publishers. The new right covers the making available for commercial purpose of any publications and their fragments, beyond individual words and the smallest text excerpts.⁷³ Again, a recent Spanish copyright reform expanded intermediary liability by introducing, *inter alia*, doctrines of secondary liability—inducement, contributory and vicarious liability—in the Spanish legal system.⁷⁴ In addition—in the footsteps of the German amendment--the Spanish reform created a highly controversial compulsory levy for news aggregators.⁷⁵ Also known as “Google tax,” the Spanish reform lead Google to terminate its Google News service in Spain.

The recent EU reform proposal would force hosting providers to develop and deploy filtering systems, therefore *de facto* monitoring their networks.⁷⁶ This proposal follows in the footsteps of a well-established path in recent intermediary liability policy: the demise of the principle of “no monitoring obligations.” In the same vein, recent case law has imposed proactive monitor obligations on intermediaries for

copyright infringement—such as Allostreaming in France, Dafra in Brazil, RapidShare in Germany, or Baidu in China.⁷⁷ Actually, the emerging enforcement of proactive monitoring obligations have been spanning the entire spectrum of intermediary liability subject matters: other intellectual property,⁷⁸ privacy,⁷⁹ defamation, and hate/dangerous speech.⁸⁰ In this context, notable exceptions—such as the landmark Belen case in Argentina—highlight also a fragmented international response to intermediary liability.⁸¹

Next, blocking orders against innocent third parties are an additional relevant trend in intermediary liability. Blocking orders have become increasingly popular in Europe, especially to contrast online copyright—and recently also trademark—infringement.⁸²

⁷⁷ See *APC et al v Google, Microsoft, Yahoo!, Bouygues et Al* (TGI Paris 2013) (France) (imposing on search engines an obligation to proactively expunge their search results from any link to the illegal movie streaming website Allostreaming and affiliated enterprises); *Google Brazil v Dafra*, Special Appeal 1306157/SP (Superior Court of Justice, March 24, 2014) (Brazil) (imposing on YouTube a proactive monitoring obligation and a strict liability standard for infringement of Dafra's copyright in a commercial dubbed by an anonymous user with comments tarnishing Dafra's reputation); *GEMA v RapidShare* I ZR 80/12 (Bundesgerichtshof, August 15, 2013) (Germany) (finding that—under the TMA—host providers are already ineligible for the liability privilege if their business model is mainly based on copyright infringement); *Zhong Qin Wen v Baidu*, 2014 Gao Min Zhong Zi 2045 (Beijing Higher People's Court 2014) (finding that it was reasonable for Baidu to exercise a duty to monitor and examine the legal status of an uploaded work once it has been viewed or downloaded more than a certain times).

Their validity under EU law was recently confirmed by the ECJ in the Telekabel decision.⁸³ Outside the EU, website blocking of copyright infringing sites has been authorised in countries including Argentina, India, Indonesia, Malaysia, Mexico, South Korea and Turkey.⁸⁴ In December 2014, Singapore effected an amendment to its Copyright Act to enable rights holders to obtain website blocking orders,⁸⁵ and in 2015 the Australia introduced to the Copyright Act "website blocking" provisions.⁸⁶ This measures have been enacted to the end of curbing intellectual property infringement online, although negative effects on human rights have been widely highlighted.⁸⁷

However, blocking orders have been widely used in multiple jurisdictions—in particular by administrative authorities—also in connection with amorphous notions of public order, defamation, and morality. In this respect, the emergence of administrative enforcement of intermediary liability online appears another well-marked trend in recent internet governance. Multiple administrative bodies have been put in charge of enforcing a miscellaneous array of online infringements—primarily against intermediaries and often absent any judicial supervision. Some administrative bodies—such as the Italian Communication Authority (AGCOM) and Second Section of the Copyright Commission (CPI)—have been provided with powers to police copyright infringement online and issue blocking orders and other decisions to selectively remove infringing digital works.⁸⁸ Many other administrative agencies enjoy broader powers of sanitization of the Internet. The Russian Roskomnadzor is an administrative body competent to request telecoms operators to block access to website featuring content that violate miscellaneous pieces of legislation and competent to keep a special registry or “blacklist” where to add websites that violate

the law.⁸⁹ In South Korea, Korea Communications Commission implements deletion or blocking orders according to the request and standards of the Korea Communications Standards Commission “as necessary for nurturing sound communications ethics.”⁹⁰ In Turkey, the law empowers the Presidency of Telecommunications (TIB) to block a website or web page within 4 hours without any judicial decision for the violation of a new category of crimes labelled as “violation of private life” or privacy.⁹¹ In India also, the Section 69(A)(1) of the IT act provides the government with the “power to issue directions for blocking for public access of any information through any computer resource,”⁹² which is dealt by a special Committee examining within seven days all the request received for blocking access to online information according to Section 69(A)(1).⁹³ In *Shreya Singhal v. Union of India*, the Indian Supreme Court confirmed the validity of blocking orders issued by under Section 69 of the IT Act, although under certain limitations.⁹⁴ Many other national administrative authorities—such as the Supreme Council of Cyberspace in Iran or CONATEL in Venezuela—do issue orders against ISPs regarding the legality, blocking and removal of online content, which do not involve—or involve very limited—judicial review.⁹⁵ Concerned views have been voiced against administratively issued blocking orders, which would undermined basic due process guarantees. In particular, they run counter the Manila Intermediary Liability Principle no. 2, which states that content must not be required to be restricted without an order by a judicial authority.⁹⁶

In the information society, the role of private sector entities in gathering information for and about users has long been a most critical issue. Therefore, intermediaries have become a main focus of privacy regulations, especially in

jurisdictions with a strong tradition of privacy protection such as Europe.⁹⁷ In a landmark case, the European Court of Justice ruled that an internet search engine operator is responsible for the processing that it carries out of personal data which appear on web pages published by third parties.⁹⁸ Multiple jurisdictions are trying to cope with “right to be forgotten” demands, following the landmark Google Spain.⁹⁹ The emergence of the RTBF—and its extra-territorial application which will be mentioned later—follows in the footsteps of a global move towards data protectionism against the *de facto* market dominance of US Internet conglomerates.¹⁰⁰ There is plenty of recent examples, including the European Court of Justice’s *Schrems* decision and the Russian Federal Law No. 242-FZ. In *Schrems*, the European Court of Justice has just ruled that the transatlantic Safe Harbour agreement—which lets American companies use a single standard for consumer privacy and data storage in both the US and Europe—is invalid;¹⁰¹ whereas Russia introduced legislation requiring that requires that the processing of personal data of Russian citizens be conducted with the use of servers located in Russia.¹⁰²

Finally, extra-territorial enforcement of intermediaries' obligations might be the next emerging trend in intermediary liability policy. This phenomenon is tightly attached to the protectionist impulses that characterize present international relationships and Internet governance. Extra-territorial enforcement made recently the headlines for the worldwide enforcement of the "right to be forgotten." European institutions endorse the view that delisting should have an extra-territorial reach. On the territorial effect of de-listing decisions, the WP29 guidelines noted that limiting de-listing to EU domains cannot be considered a sufficient means to satisfactorily guarantee the rights of data subjects according to the ruling. In practice, "this means that in any case de-listing should also be effective on all relevant .com domains."¹⁰³ Recently—in accordance with the WP29 Guidelines—the Commission Nationale de l'informatique et des Libertés (CNiL), the French data protection authority, ordered Google to apply the RTBF on all domain names of Google's search engine, including the .com domain.¹⁰⁴ Meanwhile, decision imposing extraterritorial effects on intermediaries have appeared also elsewhere. The Court of Appeal of British Columbia issued an order requiring Google to remove websites from its worldwide index. The court order—which is now under review with the Supreme Court of Canada—is unprecedented for Canada as it forces Google to remove links anywhere in the world, rather than only from the search results available through Google.ca.¹⁰⁵ While extra-territorial enforcement might potentially break the Internet, it is telling of a disconnection between physical and digital governance of information and content that will hardly go away, at least for some time.

IV. CONCLUSIONS

Given the online intermediaries' role in the digital interconnected society, their liability for the speech and content they carry has become a primary policy concern. Much has changed since the inception of the first online intermediaries—and their regulation. New challenges have renewed a discussion regarding the scope of intermediaries' duties and obligations. The WILMap has been developed to promote understanding of a confused international legal framework. Several other projects in the last few years have aimed at reducing uncertainty regarding the international intermediary liability conundrum online. This uncertainty can hurt users by potentially

LinkedIn does not comply with recent legal obligations in Russia that require all companies doing business in the country to store their data locally).

scaring companies away from providing innovative new services in certain markets. Additionally, companies may unnecessarily limit what users can do online, or engage in censorship-by-proxy to avoid uncertain retribution under unfamiliar laws. National courts and authorities, on the other hand, may seek extra-territorial enforcement to prevent any access to infringing materials in their jurisdiction. As a result, in an apparently confused legal and theoretical landscape, there is a growing tendency towards Internet fragmentation, which is made even more obvious by unconcealed national tendencies toward data protectionism.

Apparently, the intermediary liability discourse is shifting towards an intermediary responsibility discourse. This process might be pushing an amorphous notion of responsibility that incentivizes intermediaries' self-intervention to police allegedly infringing activities in the Internet. Several emerging legal trends in the intermediary liability domain reflects this change in perspectives, such as indeed voluntary agreements and private enforcement, but also other legal arrangements that make more prominent the role of online intermediaries. This is apparently the case of three-strike legislations, blocking orders dealt almost entirely between intermediaries and rightholders, and administrative enforcement of intermediary liability online. Meanwhile, retraction of intermediaries' safe harbors, proactive monitoring obligations, and the wider enforcement of blocking orders do further accomplish the goal of turning online intermediaries into Internet police.
