THE CAUSALITY OF PANDEMIC IN 2020

There are many ongoing debates about the causality of Corona as pandemic, but there should not be a single debate about the globalized effect of this pandemic on our very basic daily life, including all the segments of people from different demographical distribution, throughout the world.

Though in today's world, where most of the segments of life like health, education, medical research and applications, entertainments, employment – are highly connected with highly sensitive globalized character, so the causalities of this pandemic were to be globalized too.

The first and foremost impact of this pandemic was to make the world almost without any movement, just when our life, from each and every ways were to be with more and more speed.

We for the very first time, may be for the first time in the modern literal history, with our latest technologies, incredible merits, exchanging of knowledge got no attacking way at all against this virus. It is pathetic that , we the human being , who just before some days , stepped onto Mars , we got to go the home for our self safety – yes it was the one and only preventive way , that was left before us , to keep our existence .

Very technically, the world got stopped at the very same point, where it was. Except the emergency services – each and every steps were stopped. And we got the basic crystal clear guidelines, from both of our Govt and Medical stuffs that – in place of mass communication we need to adopt and practice the social distancing system to stay far from each and everyone for basic safety . In place of discovering the world, we need to switch our home into world for basic safety. In place of superfast movement, like communication, production – we just need no movement for our basic safety.

In short, the specialists entitled it as “LOCK DOWN “ . Life never came to such a stopping point before. So, to be very technically, we faced something, that was beyond our imagination.

The overall experience is almost same everywhere. It is dull. It is regularly monotonous. It is panicked. It is blind everywhere. No one could escape from it.

But still as the world is not based on equalities, same distribution and same vision – so very automatically, the impact of this lockdown due to pandemic – varied from place to place, time to time, and person to person.

As India is one of the largest countries with human resources, natural prosperities, and one of the biggest grounds for the investor, so no doubt that the impact of this lockdown in India is one of yet biggest key factor to the rest of the world. And this impact is not just restricted within any particular area , rather for the whole world it is going to be the leading area and factor – it may be in the case

community transmission , preventive and curative steps against the pandemic , and no doubt for the economical structure for the “era after corona “ .

So here I started to take a look about the impact of this lockdown on the life of common Indians. Many more sectors, category of people, and aspects are yet to be added.

In my first attempt, I tried to make a survey report by Google Doc. just on 100 persons including various grounds to have the very basic line, so that in future we may get more people with different conditions to judge the overall impact in depth.

Before I am going to present the ongoing situations to get basic trend, I am confirming it again, that just an online survey within 100 people is never enough to get the country’s condition. It is just an effort to have the basic trend and we confirm to add more and more people and more and more sectors, so that in future, we may get a distinct concept about the ongoing and upcoming changes, those are coming to our daily life and life-based concept and activities.

Here I focus on some basic areas ----

- 1) **Food Stock** – In time of lock down, 79 % people were with their normal food stock, 10% people were with low food stock and only 7% people were with high level of normal food stock.
Here the term “NORMAL FOOD STOCK “ – is very conflicting ,as distribution is a big factor in India.

- 2) **Regular Medicine** - Just 8% people had a rich stock of regular medicines, on the contrary 15% people had no basic stock, and 14% had low stock and 63% had normal stock as per their need. Almost 29% people had to suffer from the need of basic regular medicines.

- 3) **Crisis medicine-** It is pathetic to get 7% people to avail crisis period medicines , where 30% people had just nothing , 40% got normal and 23% got at the lowlevel.

- 4) **Pathological test** – When all kinds of medical test could be a big factor , then 33% people got not even simple pathological test , 29% people managed somehow at low level and just 36% people got them at normal level.

- 5) **Delivery report of medical test** - Here just 35% people got the service as normal , but 39% got nothing and 24% were served at poor level.

- 6) **Stock of Ration** – 62% people were given normal service and 17% were with high level service, but 10 % people got nothing and 11 % were served at lowlevel.

- 7) **Food quality of Ration**- As per 65%, it was normal, but to 10% and 11% people it was nothing or low and as per 17% it was of highquality.

- 8) **Policing System**- As per 50%, it was normal, but to 23% and 11% people it was nothing or low and as per 16% it was of high level.

- 9) **Social Awareness-** As per 42%, it was normal, but to 3 % and 9% people it was nothing or low and as per 46% it was of high rated.

- 10) **Social Relationship-** As per 44%, it was normal, but to 6% and 39% people it was nothing or low and as per 11% it was of high level.

- 11) **Personal Relationship-** As per 62%, it was normal, but to 6% and 21% people it was nothing or low and as per 11% it was of high level.

12) **Family Relationship**-As per 57%, it was normal, but to 2% and 10% people it was nothing or low and as per 31% it was of high level

13) **Misunderstanding Relationship**- As per 41%, it was normal, but to 14% and 25% people it was nothing or low and as per 20% it was of high level

14) **Psychological Stress**- As per 32%, it was normal, but to 20% and 22% people it was nothing or low and as per 26% it was of high level

- 15) **Psychological Stress due to Financial Depression-** As per 33%, it was normal, but to 19% and 23% people it was nothing or low and as per 25% it was of high level.

- 16) **Psychological Stress due to anxiety related to Profession -** As per 35%, it was normal, but to 19% and 15% people it was nothing or low and as per 31% it was of highlevel.

- 17) **Psychological Stress due to Conjugal Relationship-**As per 45%, it was normal, but to 30%and 13% people it was nothing or low and as per 12% it was of highlevel.

- 18) **Psychological Stress due to sudden change in lifestyle of Children-**As per 42%, it was normal, but to 21% and 14% people it was nothing or low and as per 23% it was of high level.

- 19) **Psychological Stress due to sudden change in lifestyle of Elderly People-** As per 41%, it was normal, but to 14% and 16% people it was nothing or low and as per 29% it was of highlevel.

- 20) **Psychological Stress Socio Financial status-** As per 41%, it was normal, but to 17% and 19% people it was nothing or low and as per 23% it was of highlevel.

- 21) **Psychological Stress due to Entertainment Level-** As per 41%, it was normal, but to 19% and 20% people it was nothing or low and as per 20% it was of high level.

- 22) **Psychological Stress due to Life Style Changing** -As per 38%, it was normal, but to 14% and 20% people it was nothing or low and as per 28% it was of high level.

- 23) **Psychological Stress due to change in Addiction Level** - As per 34%, it was normal, but to 30% and 22% people it was nothing or low and as per 14% it was of high level.

Conclusion: -

It is clear from the ongoing situations throughout the world, that it is not so easy now to conclude the causalities of this pandemic. No doubt that most of the scholars including medical researchers, doctors, environmental researchers, people working with politics, economy, sociology and so many grounds are now at a common point - and that point is of change. But none is sure about the ultimate change that is already is faced by all of us. The first and foremost point is that we are yet to have a common solution point. It is not possible too now as we just entered into the situation. And through such a little effort it is not possible to mark any area to be focused or not. It is just a trend checking survey and I got some areas like employment, food chain, social attachments, and habitations to be the first level of change. But the way the total situation is being changed so fast, it will be better observed. And these times I surveyed on 100 people from different demography, but this is not enough. As the situation moves on and I will work on more and more people, hope we may get the vibes of upcoming changes.

-----Thank You-----
