Abstract

Aside from the title, abstract, keywords, and references, I guess we have just set a new world record for the shortest article, i.e., one word (two letters, actually). This is a serious nanoarticle, published in the Open Journal of Mathematics and Physics (OJMP) [1]. It poses a valid and important scientific question and address the solution by using methods of research, including the communication of the result in the format of an article, with title, author, affiliation, abstract, keywords, and references. The OJMP is an overlay open access journal, 100% free to read and to publish, mainly with the purpose to show that there are other ways of doing science beyond the traditional way.

keywords: nanoarticle, one word article

No! [2–5]
