Metastasis to the brain is a clinical problem in patients with breast cancer¹⁻³. We mined published microarray data^{4,5} to compare primary and metastatic tumor transcriptomes for the discovery of genes associated with brain metastasis in humans with metastatic breast cancer. We found that dehydrogenase/reductase 13, encoded by DHRS13, was among the genes whose expression was most different in the brain metastases of patients with metastatic breast cancer as compared to primary tumors of the breast. DHRS13 mRNA was present at increased quantities in brain metastatic tissues as compared to primary tumors of the breast. Importantly, expression of DHRS13 in primary tumors was significantly correlated with patient recurrence-free survival. Modulation of DHRS13 expression may be relevant to the biology by which tumor cells metastasize from the breast to the brain in humans with metastatic breast cancer.

Keywords: breast cancer, metastasis, brain metastases, central nervous system metastases, the dehydrogenase/reductase 13, DHRS13, systems biology of breast cancer, targeted therapeutics in breast cancer.

One report described a 34% incidence of central nervous system metastases in patients treated with trastuzumab for breast cancer². More recently, the NEfERT-T clinical trial⁶ which compared administration of either neratinib or trastuzumab in conjunction with paclitaxel demonstrated that in a randomized, controlled setting, in breast cancer patients treated with neratinib, not only was the incidence of central nervous system recurrence significantly lower, the time to central nervous system metastasis was significantly delayed as compared to patients administered trastuzumab⁶. The alarmingly high rate of central nervous system metastasis described, as well as data, both anecdotal² and from a randomized, controlled setting⁶ illustrating that treatment with trastuzumab may be associated with these events demands an enhanced understanding of the transcriptional makeup of brain metastatic tissues to support identification of therapeutic targets, whether they are treatment related or not. We performed a global comparative analysis of primary and metastatic tumors in patients with brain metastatic breast cancer^{4,5}. We discovered differential and increased expression of the gene encoding the dehydrogenase/reductase 13, DHRS13, in brain metastatic tissues of patients with metastatic breast cancer.

Methods

We used datasets GSE10893⁴ and GSE52604⁵ for this global differential gene expression analysis of brain metastatic breast cancer in conjunction with GEO2R. GSE10893 was generated using Agilent-011521 Human 1A Microarray G4110A technology with $n=11$ primary breast tumors and $n=3$ brain metastases from patients with breast cancer; analysis was performed using platform GPL885. GSE52604 was generated using Agilent-014850 Whole Human Genome Microarray 4x44K G4112F with $n=10$ normal breast tissues and $n=35$ brain metastases from patients with breast cancer; analysis was performed using platform GPL6480. The Benjamini and Hochberg method of p -value adjustment was used for ranking of differential expression but raw p -values were used to assess statistical significance of global differential expression. Log-transformation of data was auto-detected, and the NCBI generated category of platform annotation was used. A statistical test was performed to evaluate whether DHRS13 gene expression was significantly different between primary tumors of the breast and brain metastases in humans with breast cancer using a two-tailed t-test. For Kaplan-Meier survival analysis, we used the Kaplan-Meier plotter online tool⁷ for correlation of DHRS13 mRNA expression levels with recurrence-free survival in $n=3951$ breast cancer patients, with auto cut-off selected.

Results

We performed global comparative transcriptome analysis of metastatic tumor tissues of patients with metastatic breast cancer using published microarray data^{4,5} to describe the transcriptional landscape of brain metastasis in human breast cancer in an unbiased fashion and for the discovery of novel therapeutic targets.

DHRS13 is differentially expressed in the brain metastases of patients with brain metastatic breast cancer.

Through blind, systems-level analysis of published microarray data⁴, we identified the

dehydrogenase/reductase 13, encoded by DHRS13, as a differentially expressed gene in the breast metastatic tissues of humans with breast cancer (Table 1). When sorting each of the genes expressed in brain metastases based on significance of difference as compared to primary tumors of the breast in patients with breast cancer, DHRS13 ranked 225 out of 17418 total transcripts (Chart 1), equating to 98.7% differential expression. Differential expression of DHRS13 in the brain metastases of patients with metastatic breast cancer was statistically significant (Chart 1; $p=6.64E-04$).

Differential gene expression analyses that utilize primary and metastatic tumor tissues to discover genes associated with metastasis can be challenging due to the relatively heterogeneous cellular composition and constitution of the tumor as compared to normal, untransformed (benign) tissues. Thus, to attempt to validate differential transcriptome-wide differential expression of DHRS13 in brain metastases in human metastatic breast cancer, we queried a second microarray dataset⁵, here comparing normal breast tissues rather than primary tumors of the breast to brain metastases. Again, we identified DHRS13 as a differentially expressed gene in the brain metastatic tissues of patients with breast cancer (Chart 2). When sorting each of the genes expressed in brain metastases based on significance of difference as compared to normal breast tissues, DHRS13 ranked 17598 out of 41093 total transcripts (Chart 2), equating to 57.2% differential expression. Differential expression of DHRS13 in the brain metastases of patients with metastatic breast cancer was statistically significant (Chart 2; $p=5.31E-02$). Thus, differential expression of DHRS13, transcriptome-wide, in the brain metastases of women with metastatic breast cancer was conserved across two independent microarray datasets, both when compared to benign and transformed breast tissues.

DHRS13 is expressed at higher levels in the brain metastases of patients with metastatic breast cancer.

We obtained exact mRNA expression levels for DHRS13, in primary tumors of the breast and in brain metastasis of patients with brain metastatic breast cancer to determine direction and statistical significance of change in DHRS13 expression in brain metastatic tissues. We observed significantly higher expression of DHRS13 in the brain metastases of patients with breast cancer as compared to primary tumors of the breast: DHRS13 was expressed at -0.31 ± 0.75 arbitrary units (AU) in primary tumors of the breast, while it was expressed at 1.38 ± 0.65 AU in brain metastatic tissues. The difference in DHRS13 mRNA levels between primary tumors of the breast and brain metastatic tissues was statistically significant (Figure 1; $p=0.001591$).

DHRS13 expression is significantly correlated with survival outcomes in human breast cancer.

We performed Kaplan-Meier survival analysis⁷ in $n=3951$ breast cancer patients in total, to evaluate whether DHRS13 tumor expression was correlated with survival outcomes in breast cancer. We observed a statistically significant correlation between primary tumor expression of DHRS13 and recurrence-free survival (RFS) in patients with breast cancer (Figure 2). Patients whose primary tumors expressed low levels of DHRS13 possessed median RFS of 37 months, while patients whose tumors expressed high levels of DHRS13 possessed median RFS of 34.8 months. This difference in RFS based on DHRS13 tumor expression in patients with breast

cancer was statistically significant (Figure 2, Chart 3; logrank p -value: 0.018; hazard ratio: 1.21(1.03-1.42); false discovery rate: >50%).

Thus, by mining published microarray data^{4,5} in an unbiased and systematic fashion, we identified the dehydrogenase/reductase 13, encoded by DHRS13, as among the genes whose expression was most different, transcriptome-wide, in the brain metastases of patients with breast cancer, both when compared to primary tumors of the breast and to normal breast tissues; we observed significantly increased expression of DHRS13 in brain metastases as compared to primary tumors of the breast. Further, we found a significant correlation between DHRS13 expression and patient survival outcomes, as recurrence-free survival was significantly greater in patients whose primary tumors expressed higher levels of DHRS13 as compared to patients whose primary tumors expressed lower levels of DHRS13.

Discussion

We provided evidence here that the dehydrogenase/reductase 13, encoded by DHRS13, is among the genes whose expression is most different in the brain metastases of patients with brain metastatic breast cancer, that DHRS13 mRNA is present at significantly increased quantities in brain metastatic tissues as compared to primary tumors of the breast, and that primary tumor DHRS13 expression is significantly correlated with patient survival outcomes in human breast cancer. Evaluation of the effects of genetic depletion of DHRS13 in mouse models of metastatic breast cancer on metastasis to the central nervous system is merited. Modulation of DHRS13 expression may be relevant to the processes by which breast cancer cells exit the breast, enter the vasculature and/or lymphatics, reside in the lymph nodes, evade immune clearance, breach the blood-brain barrier and colonize the brain.

Figure 1: DHRS13 is expressed at significantly higher levels in the brain metastases of patients with metastatic breast cancer when compared to primary tumors of the breast.

The mRNA expression level of DHRS13 in primary tumors of the breast (left) and in brain metastases of women with metastatic breast cancer (right) is graphically depicted; the result of a statistical test evaluating significance of difference in DHRS13 expression between primary tumors of the breast and brain metastases, a *p*-value, is *p*=0.001591.

Figure 2: Significant correlation between DHRS13 primary tumor expression and recurrence-free survival in patients with breast cancer, but with high false discovery rate.

Depicted in this Kaplan-Meier plot is the probability of recurrence-free survival for $n=3951$ total patients stratified into two groups, based on low or high expression of DHRS13 in patient primary tumors. The log rank p -value denoting statistical significance of difference in recurrence-free survival when comparing the two groups, as well as hazard ratio for this comparison is listed above. Listed below is the number of patients at risk (number of patients alive) per interval, after stratification based on DHRS13 expression; in the first interval, number at risk is number of patients alive; in each subsequent interval, number at risk is the number at risk less those who have expired or are censored; the false discovery rate is $>50\%$.

Low DHRS13 expression: 37 months
High DHRS13 expression: 34.8 months

Chart 3: Median recurrence-free survival is inferior in patients with high primary tumor expression of DHRS13.

The median RFS (recurrence-free survival) of patients with low primary tumor expression of DHRS13 and high primary tumor expression of DHRS13 is listed in this chart, for $n=3951$ breast cancer patients.
